Ligatures in Linux Libertine using LuaHBTeX

According to Wikipedia this font contains quite a wide range of ligatures, and also a variant form of W created for their titling. That needs to be specified e.g. using the known unicode value from the private area we can get WIKIPEDIA.

This list of words tries to find character combinations which will create, I hope, ligatures - not just the common first fjord effluent flicker but acts heft chap luck. Maybe even Quidditch.

The article suggested that ch ck ct fi ff ffl fj fl ft st Qu Th all have ligatures in this font, but looking at this I'm not convinced about the c* variants - compare ca cb cf cu.
